

Fullstack Take-Home Assignment

Overview

Format: Paid take-home assignment

Expected duration: 4 hours

Build a Wallet Watchlist application - a full-stack product with a REST API and web UI that lets users manage crypto wallet addresses and inspect portfolio data. Deep blockchain knowledge is not required; mocked data is acceptable.

Repository Structure

This repository contains three branches:

- * main - general assignment overview (this document)
- * scratch - build the full app from scratch; full brief included
- * boiler-plate - Express API + React UI starters with TODOs

Getting Started

Follow these steps:

- * Read this overview
- * Choose a path and checkout the branch:

```
git checkout scratch
```

```
# or
```

```
git checkout boiler-plate
```
- * Read the README and HOME_TASK_GUIDE on your chosen branch
- * Implement both the API and the UI
- * Submit your repo plus short notes on decisions and trade-offs

What to Build

Candidates implement a full-stack app to:

- * Build a REST API for wallet CRUD, assets, and activity
- * Build a web UI for wallet list, detail, and forms
- * Wire the frontend to the backend end-to-end
- * Handle validation, errors, and loading states on both layers

Path Comparison

scratch: You design the architecture, stack, and project structure yourself. Best if you want full creative control.

boiler-plate: Express API and React UI starters with route/component stubs, API client, and helpers. Best if you prefer focusing on implementation over project setup.

What We Evaluate

- * API design, validation, and persistence
- * Component architecture and state management

- * End-to-end integration between UI and API
- * Error handling and user feedback on both layers
- * Code organization and project structure
- * Basic tests (optional, if time allows)

Guidelines

- * Time-box to 4 hours; note any trade-offs in your submission
- * Any mainstream full-stack setup is fine
- * File DB or SQLite is sufficient for persistence
- * Do not over-engineer - a clean, working app is the goal

Submission

Include a runnable app with setup instructions for server and client, 5-10 bullet notes on architecture decisions and assumptions, and optional screenshots.

Compensation

This is a paid take-home assignment. Compensation applies whether or not we proceed to the next stage.
